

Enhancing your information security

Add-on security solutions that will protect your business, increase compliance with financial services cyber security regulations and help your firm meet global standards in information security

Maintaining your financial services information security isn't just about protecting your FCA-regulated business; it's a key part of your data security compliance obligations and ensures you shield the business against new cyber threats.

Flexible compliance solutions to give you enhanced information security

Lanware is partner to numerous financial services businesses worldwide - including fund managers with more than £150 billion of assets under management. Our expertise in cloud technology for FCA-regulated business means we understand the regulatory context you operate in

and the security levels and oversight it takes to manage risk and regulation.

Our range of enhanced security services enables your compliance, lowers your risk and gives you auditable evidence to reassure your partners and investors that your security controls are fail-safe.

Our security services include:

Phishing Tests

Innovative and tailored phishing tests, devised and delivered by our Security Consultants, designed to enable the continued testing of your users against real-world and recent trends observed in the wild. Tests can range from a single mailshot for all users, to spear phishing and bespoke campaigns tailored to specific business units.

The phishing tests provide real-time reporting and self-service training can be delivered automatically at the completion of the test.

Lanware Recommends: Performing these at least quarterly.

Vulnerability Assessments

Lanware can provide external and internal automated vulnerability assessments utilising the industry leading tools and cyber security procedures. Results are analysed on a monthly basis and, if needed, a remediation plan is created and presented.

This ongoing assessment allows for faster mitigation against potential exploits and a high level of assurance of patching efficacy.

Internal Security Audits

Security best practice is an ever-moving target, and often in the time since a system was implemented the design of that system may fall short of current security standards. Lanware will provide a full audit of all systems internally, picking apart any settings, firewall rules, and analysing all user accounts and privileges. Users' passwords will be audited against dumps of common exposed passwords to ensure you are in the best possible security standing.

Lanware Recommends: We propose to perform this level of audit every year.

Physical Site Security Audits

Having a secure technology platform means very little if physical, environmental and site security is weak. Lanware will review all aspects of your site security, including physical access controls, wireless security, system security (network ports, computer terminals, printers, and so on) to close any holes that an attacker may leverage. A report will be presented based on these findings laying out possible risk and available mitigations.

Breach Detection and Alerting

Users are compromised every week due to being exposed to a part of a wider "password dump"

from a hack of a third party, such as BA, Yahoo or Equifax. Lanware will continually monitor a user's business email address, along with up to two personal accounts, and provide timely notifications of any breaches occurring containing their details.

Cyber Landscape Reporting

With our dedicated team we will provide tailored, expert advice in a regular bulletin giving you visibility of cyber threats as they develop and specifically how they affect you, along with the time to communicate and act upon them with remediation recommendations.

Security Reviews and Consultancy

In addition to the current level of security reporting we will provide more regular analysis, engagement and reporting. This will involve extra time with our Consultants to deliver reports or to work with you in understanding and developing your business security plan. This additional reporting can be used to aggregate the output of all security related engagements and help steer any remediation work.

User Awareness Training

All the technical controls in place are worthless unless users are provided with salient advice on how to stay safe and fend off potential future attacks. Lanware can engage directly with your users either in person or via easy to digest presentations to help impart cyber security awareness.

Cyber Security Incident Simulation

Historically regulated firms have focused heavily on testing business continuity procedures designed to mitigate traditional risks such as fire, flood or power outages. The reality is today Cyber Threats are the biggest risks and most likely to destroy your business. A Lanware Cyber Security Incident Simulation is a managed test, which simulates a major Incident such as an outbreak of

Lanware will continually monitor a user's business email address, along with up to two personal accounts, and provides timely notifications of any breaches occurring containing their details

a cryptolocker type malware and data breach. During the test Lanware consultants work to establish how the incident was identified, how it escalated, and look at the impact in terms of data leakage, downtime etc. The test is designed to improve internal processes, knowledge and general readiness.

How we work:

Our range of tailored add-on security services are designed to give you the extra support you need to run your business in a FCA-regulated environment. We provide the latest best practice and observed behaviours from our wealth of experience in financial services. And because we operate within our ISO 270001 framework our strong ethos enables us to build appropriate security controls for your business.

Why Lanware?

With deep, long-standing expertise in the financial service sector, Lanware understands the challenges that our clients face around regulatory compliance and configure specific settings to face these challenges head on. Lanware provides you with a complete choice of outsourced IT security services – all tailored to your needs.
