

Information Security & Compliance

Meeting FCA outsourcing regulations and global standards on information security.

Information Security

Working exclusively with FCA and PRA-regulated clients, Lanware puts security in the spotlight.

Every service we provide, every partner we select, and every colleague who joins our team – they're all linked by a focus on information security.

An independently assessed security system

Our Information Security Management System (ISMS) is audited by the British Standards Institute (BSI) and certified to the ISO27001 standard – an internationally recognised best practice management standard for information security. Only one in every 2,500 UK private sector businesses have achieved such a high standard.

The ISMS is built on the following core principles, which are requirements of the standard:

Context

Includes assessment of internal stakeholders (governance, capabilities, culture and contracts) and external factors (environmental conditions, trends and drivers).

Leadership

Senior Management are closely involved in creating and supporting the ISMS, establishing the Information Security Policy, and ensuring security roles and responsibilities are clearly defined.

Support

Information requirements of the ISMS are defined, and controls are implemented to manage the handling of all ISMS documents.

Planning

Identification of risks and opportunities along with risk assessment and treatment processes allow us to create security objectives and plans to achieve them.

Operations

The conduct of regular security committee meetings in order to ensure operational planning and control processes, so that any risk treatment plans are enforced.

Evaluation

We monitor, measure analyze and evaluate information security. Internal and BSI external audit programs are implemented to evaluate ISMS performance.

Improvement

Continual improvement of the ISMS suitability, adequacy and effectiveness is a core principle of the ISO27001 standard.

- Reduces operational and managerial overheads
- Creates clear and transparent fiscal models for your organisation

Security and compliance at every level

With Lanware, every aspect of your infrastructure is hosted in an enterprise-grade datacentre. There, it is managed and monitored by experts in information security, under an ISO27001 certified Information Security Management System (ISMS).

Infrastructure

Your cloud-based infrastructure is located in a redundant, highly available, and highly secure tier 1 industry leading data centre.

Desktop

Users can access their secure desktop from anywhere, allowing them to work flexibly.

Applications

Every application is patched to protect against latest vulnerabilities, managed and controlled in a single centralised instance.

Backups & Disaster Recovery

Data is replicated between distinct geographic locations, avoiding the risk of complete loss in the event of a local disaster.

All managed on your behalf and monitored around the clock.
